INTRODUCTION

Scope of this manual

This manual provides necessary technical information for the maintenance and inspection of mobile radio BJ-9900. Maintaining this device needs professional knowledge of the operation of surface chips assemble Non-professional operation will lead to permanently damages other than quality assurance, and even in some countries it may be illegal.

This manual is generally correct and complete, but Baojie will not bears any responsibility for the damages caused by typographical or other errors. If any technical information discrepancies are found , please note that we will be very grateful.

Baojie reserve explanation rights. Meanwhile ,Baojie company will remain the right of changing product designs and specifications

Personal Security

- For personal safety, please note the following tips:
- Do not transmit before all the RF plugs are carefully confirmed or any open plug have not be connect to the matching port.
- Turn off the power and do not operate this equipment when near the the electric squib or near flammable gas .
- To avoid electromagnetic interference or problems caused by the battery compatibility, please turn off the radio where there are marks " NO RADIO",such as hospitals and other health care place

CIRCUIT DESCRIPTION

Receiver signal channel

Main band 430MHZ Signal

430MHz signal transmits to Antenna through a high pass filter network, and a low pass filter network switching diode D1029,D1030{ }and }D1001, then transmit to Main band RF amplifier Q1001 through another low pass filter network.

Amplified 430MHz signal transmits to Tuned vibration variable resistance filter network through the switch D1002,which include D1004.D1005 ,D1006 and related circuit. and then it transmits to the first mixer Q1003.Meanwhile UHF local oscillator signal which comes from UHF-VCO/BQ1116 transmit to the first mixer Q1003 and generate first IF of 38.55MHz main band.

Main band 144 MHz signal

144MHz signal transmits to Antenna through a high pass filter network, and a low pass filter network switching diode D1113,D1114,D1115, D1116 and D1117 then transmit to Main band RF amplifier Q1014 through another low pass filiter network.Amplified 144MHz signal transmits to first mxier Q1016 through Tuned vibration variable resistance filter network th including D1017.D1005 ,D1006 and related circuit.

Meanwhile VHF local oscillator signal which comes from VHF-VCO/BQ1120 transmit to the first mixer Q1016 and generate first IF of 38.55MHz main band .

Main band IF and audio signal

38.55MHz main band first IF signal is sent to the crystal filter FL1001 and FL1002. The crystal filter to remove those unwanted mixer products, and then sent to the IF amplifier Q1027 IF IC IC1044.

Meanwhile the 13MHz Crystal part X1002 export the triple frequency via Q1042 to generate 39MHz second local oscillator signal and transimit to IF IC1044 where 39MHz second LO and 38.55MHz Main band first LO mixed to be 450KHz Main band second IF.

450KHz main band second IF through the filter switch D1039/D1041 transmit to Ceramic Filter which remove the other signal except the useful and then transmit to ceramic discriminator CD1001 via the IF amplifier in IC1044.The ceramic discriminator will remove any Variance in Amplitude in 450KHz IF signal before voice detecting .

Demodulated Main band audio restore the network band networking and audio switch through signal, and then handle by audio processor IC1042.And the filtered audio signal transmit to audio switch IC1066 and IC1067.

When the built-in speaker is selected, the audio signal will be amplified by IC1069 and then be provided to the built-in speaker.When the external speaker is selected, the audio signal will be amplified by IC1068 and then transmit through the external speaker jack to the external speaker.

sub-band 430MHz signal

430MHz signal transmits to Antenna through a high pass filter network, and a low pass filter network switching diode D1029,D1030{ }and }D1001, then transmit to sub-band

RF amplifier Q1002 through another low pass filter network.

Amplified 430MHz signal transmits to Tuned vibration variable resistance filter network through the switch D1009, which include D1011,D1012 ,D1013 and related circuit. and then it transmits to the first mixer Q1005. Meanwhile UHF local oscillator signal which comes from UHF-VCO/AQ1123 transmit to the first mixer Q1003 and generate first IF of 49.95MHz Sub-band

Sub-band 144MHz Signal

144MHz signal transmits to Antenna through a high pass filter network, and a low pass filter network switching diode D1113,D1114,D1115, D1116 and D1117 then transmit to Main band RF amplifier Q1015 through another low pass filter network. Amplified 144MHz signal transmits to first mixer Q1017 through Tuned vibration variable resistance filter network including D1020.D1021 ,D1022 and related circuit.

Meanwhile VHF local oscillator signal which comes from VHF-VCO/AQ 1126 transmit to the first mixer Q1017 and generate first IF of 49.95MHz sub-band .

Sub-band IF and audio signal

49.95MHz sub-band first IF signal is sent to the crystal filter FL1003 and FL1004. The crystal filter remove those unwanted mixer products, and then through the IF amplifier Q1035 sent to IF IC IC1047.

Meanwhile the 16.8MHz Crystal part X1003 export the triple frequency via Q1043 to generate 50.4MHz second local oscillator signal and transmits to IF IC1047 where 50.4MHz second LO and 49.95MHz sub-band first signal mixed to be 450KHz sub-band second IF.

{450KHz sub-band second IF transmit to Ceramic Filter CF1003 which remove the

other signal except the useful and then transmit to ceramic discriminator CD1001 via the IF amplifier in IC1047. The ceramic discriminator will remove any Variance in Amplitude in 450KHz IF signal before voice detecting . The ceramic discriminator will remove any Variance in Amplitude in 450KHz IF signal before voice detecting .

Demodulated sub-band audio restore the network and audio switch D1048 through signal, and then handle by audio processor IC IC1043. And the filtered audio signal transmit to audio switch IC1066 and IC1067.

When the built-in speaker is selected, the audio signal will be amplified by IC1069 and then be provided to the built-in speaker. When the external speaker is selected, the audio signal will be amplified by IC1068 and then transmit through the external speaker jack to the external speaker.

Squelch control

Main band

when there is not receivable carrier signal in main band , the output nosies for the IC1044 detector will be amplified while the band pass will be filtered by the IC1044's noises amplified part. The generated direct voltage will be transferred to of Main CPU IC1104 pin31 which will compare the squelch standard level with the settable squelch level in the front panel which can setted through SQL key.

when there is no receivable carrier signal in main band , The pin76 in IC110 will keep in LOW position to forbidden the audio output of the speaker.

Sub-band

when there is not receivable carrier signal in sub-band , the output nosies for the IC1047 detector will be amplified while the band pass will be filtered by the IC1047's noises amplified part. The generated direct voltage will be transferred to of Main CPU IC1107 pin28 which will compare the squelch standard level with the settable squelch level in the front panel which can setted through SQL key.

Transmitter signal channel

Audio signal

The audio signal which arrive at loud-speaker are transferred to the audio amplifier U3001 of PANEL-SUB UNIT through the Mic Plug J3004.The amplified audio signal via the front panel separated plug J3002 and J1005 transmit to TX-RX unit where the audio signal is transferred to the audio processor IC IC1042 and related circuit.

430 MHz signal

The audio signal which arrives at 1 IC1042 are transferred to variable resistance diode through transistor exchanger Q1114 and Q1115.Where the frequency modulates composed and emission voltage controlled oscillator which compose of UHF-VCO/B Q1116 and D1081.

Adjusted transmitting signal through a buffer amplifier Q1117, Q1118, Q1119 and diode switch D1099, D1101 sent to the preamplifier Q1132.

Amplified transmitting signal reaching Q1132 transmit to diode switch D1107 through the diode switch D1106 and drive amplifier, and finally be amplified by power amplifier Q1135 to generate more than 35W output power .These three steps are controlled by auto power control circuit.

35W RF signal through a high pass filter network transmit to the antenna switch D1118, D1119 and D1120, and then through a low pass filter network, and another high-pass filter network transmits to the antenna jack.

144 MHz signal

The audio signal which arrives at IC1042 are transferred to variable capacitance diode D1082 and D1085 through transistor exchanger Q1114 and Q1115.

Amplified transmitting signal reaching Q113 2transmit to diode switch D1108 through the diode switch D1105,D1106 and drive amplifier, and finally be amplified by power amplifier Q1135 to generate more than 50W output power .

Q1132 come to be amplified transmission signal via a diode switch D1105, D1106, and sent to the diode drive amplifier switch Q1134 D1108, Q1135 ultimately amplified by the power amplifier, resulting in more than 50W of output power.These three steps are controlled by automatic power control circuit.

50W RF signal through a high pass filter network transmit to the antenna switch D1113, D1114 and then through a low pass filter network, and another high-pass filter network transmits to the antenna jack.

Automatic power control circuit

430 MHz signal

Part of the output of the power amplifier corrected by the D1121 and D1122, Then sent to the APC Automatic Power Control IC1129. As a DC voltage, APC Automatic Power Control of the power amplifier output level is proportional to.

In IC1129 on, come to the power amplifier and the DC voltage correction over to the main CPU IC1104 to the reference voltage to produce a control voltage. The control voltage regulated power supply voltage to the preamplifier Q1132, Q1134 driver amplifier and power amplifier Q1135, in the case of changing the antenna load to maintain a stable output power.

144 MHz signal

Part of the output of the power amplifier corrected by the D1109 and D1110, and then sent to the APC Automatic Power Control Q1129. As a DC voltage, APC Automatic Power Control of the power amplifier is proportional to the output level.

On the Q1129 to correct over to the power amplifier to the DC voltage to the main CPU IC1104 with the reference voltage to produce a control voltage. The control voltage regulated power supply voltage to the pre-amplifier Q1132, Q1134 driver amplifier and power amplifier Q1135, in the case of changing the antenna load to maintain a stable output voltage.

PTT Electric circuit

430 MHz signal

When you press the PTT switch, the sub CPU U2001's pin 23 to the "low" position,

then launch "PTT" command to the main CPU IC1104.

When the "PTT" command is received, the main CPU IC1104 pin 45 to the "high" position, then activates the UHF transmitter switch Q1096.

When the Q1096's UHF transmitter switch is activated, it controls the antenna switching diode D1118, D1119, D1120, modulation switching diode Q1114, Q1115, diode switch D1099, D1101, D1106, D1107, and APC automatic power switch Q1130, Q1131. These activated the 430 MHz transmitter circuit.

144 MHz Signal

When you press the PTT switch, the sub CPU U2001's pin 23 to the "low" position, then will launch the "PTT" command to the main CPU IC1104.

When the "PTT" command is received, the main CPU IC1104 pin 46 to the "high" position, then activates a VHF transmitter switch Q1096.

When Q1096 for VHF transmitter switch is activated, it controls the antenna switching diode D1118, D1119, D1120, modulation switching diode Q1114, Q1115, diode switch D1099, D1101, D1106, D1107, and APC automatic power switch Q1130, Q1131. These activated the 144 MHz transmitter circuit.

PLL Electric circuit

Main band

Come to UHF-VCO / B Q1116 part of the output buffer amplifier Q1117 and through diode switch D1086, sent to the PLL IC1109 programmable divider. Here it is according to the main CPU IC1104 related to the frequency division data is divided and sent to the

phase comparator.

Come to the VHF-VCO / B Q1120 part of the output buffer amplifier Q1121 and through diode switch D1087, sent to the PLL IC1109 programmable divider. Here it is according to the main CPU IC1104 related to the frequency division data is divided and sent to the phase comparator.

13 MHz reference oscillator X1003 frequency components via IC1109 2340 or 1872 in the reference divider is separated to form a 5 kHz or 6.25 kHz reference frequency compared these baseline frequency will be utilized by the phase comparator.

IC1109 phase comparator circuit of the voltage controlled oscillator and the oscillation frequency of the frequency of the phase comparison between the frequency comparison. Its output is a pulse with the same phase. The pulse by controlling the voltage in the loop filter are integrated to control the oscillation frequency of the VCO.

Sub-band

Come to UHF-VCO / A Q1123 part of the output buffer amplifier Q1124 and through diode switch D1093, sent to the PLL IC1112 programmable divider. Here it is according to the main CPU IC1104 related to the frequency division data is divided and sent to the phase comparator.

Come to the VHF-VCO / A Q1126 part of the output buffer amplifier Q1127 and through diode switch D1097, sent to the PLL IC1112 programmable divider. Here it is according to the main CPU IC1104 related to the frequency division data is divided and sent to the phase comparator.

16.8 MHz reference oscillator X1003 frequency components via IC1112 2340 or 1872

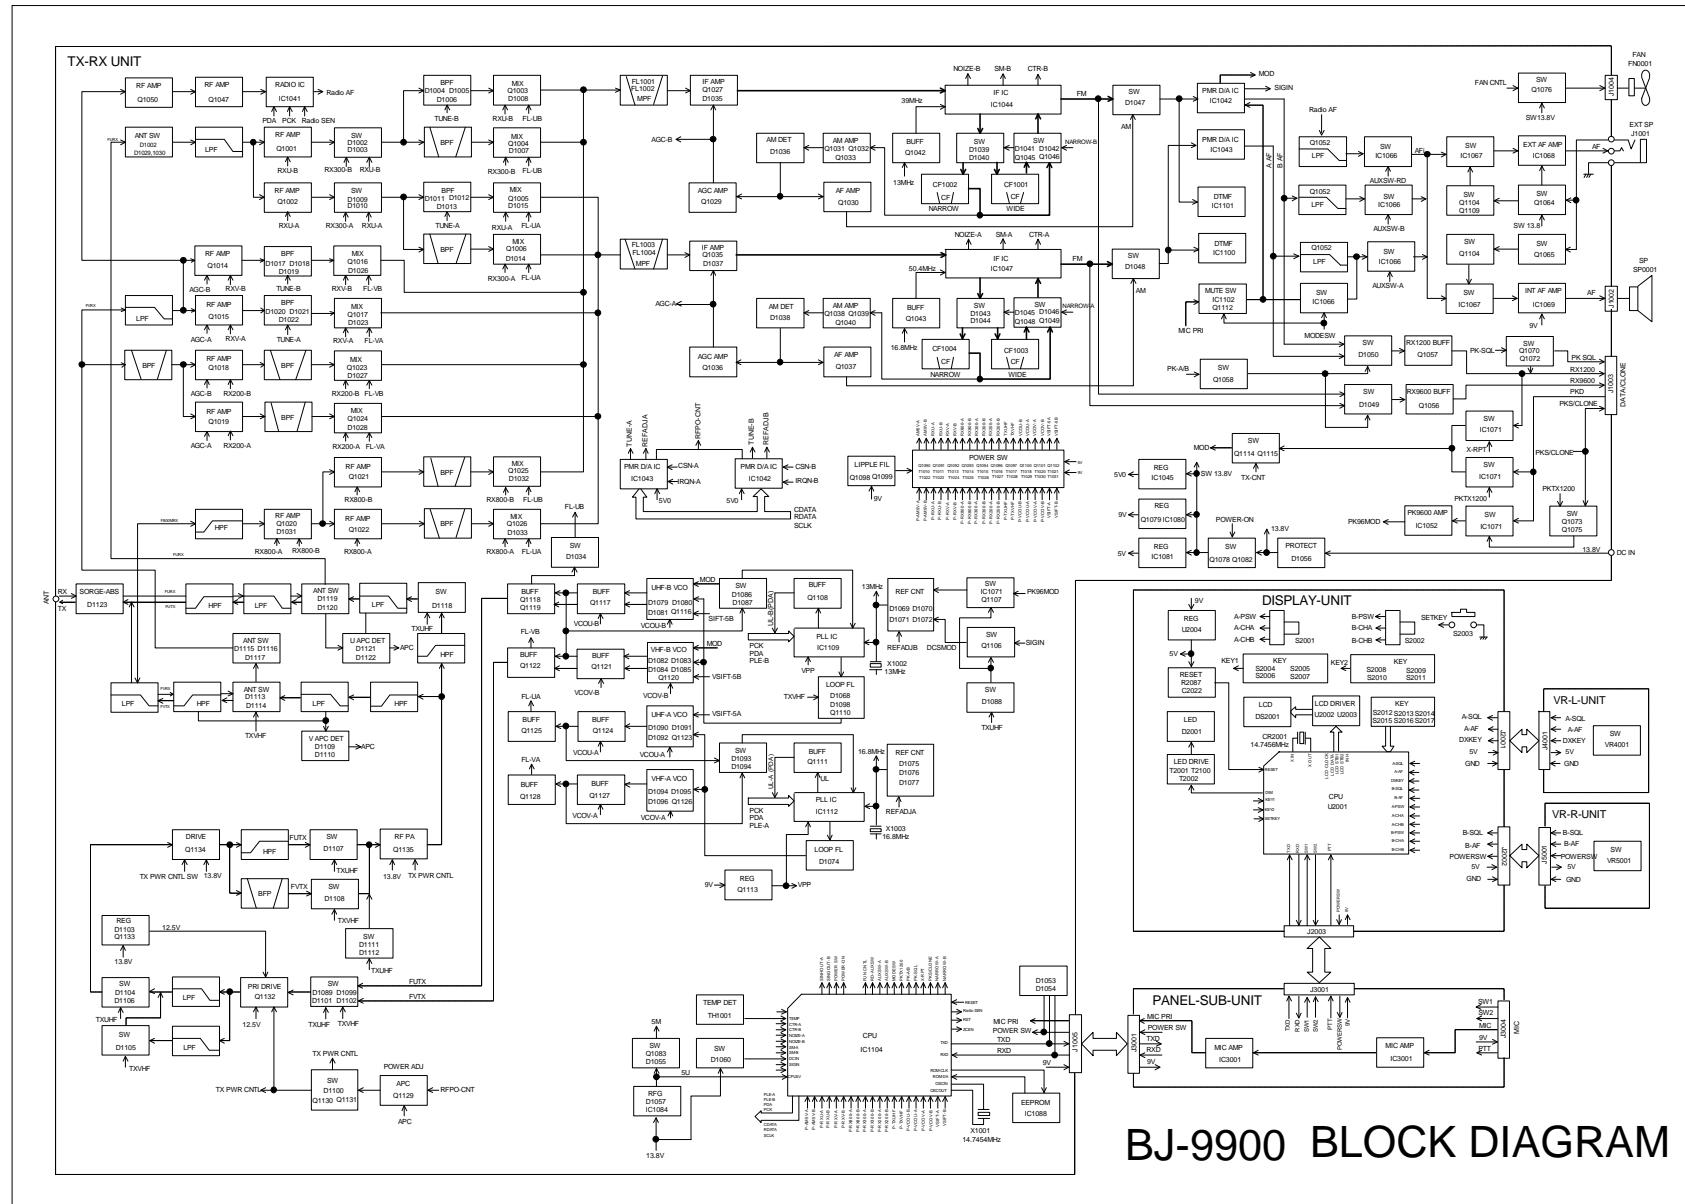

in the reference divider is separated to form 5 kHz or 6.25 kHz reference frequency compared these baseline frequency will be utilized by the phase comparator. .

IC1112 phase comparator circuit of the voltage controlled oscillator and the oscillation frequency of the frequency of the phase comparison between the frequency comparison. Its output is a pulse with the same phase. The pulse by controlling the voltage in the loop filter are integrated to control the oscillation frequency of the VCO. .

Power control

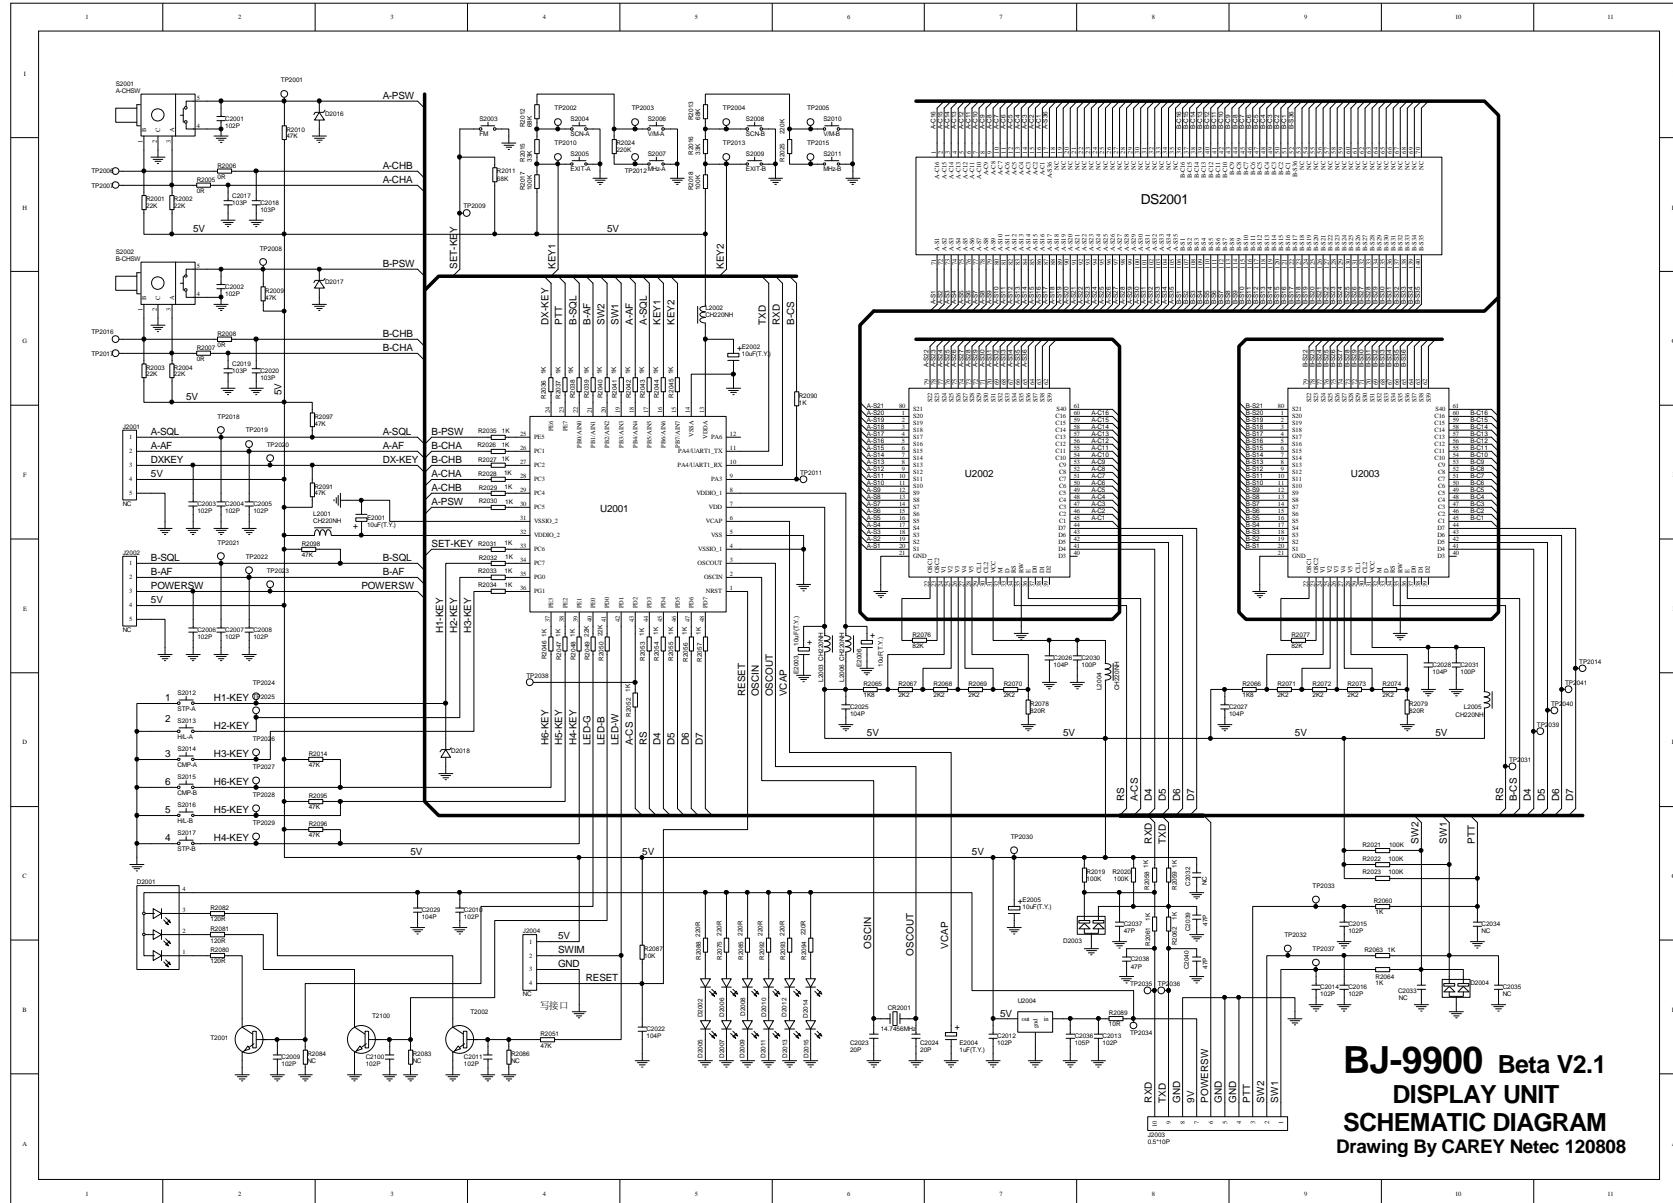

When the user holds down the right volume button for 2 seconds, the main CPU IC1104 of pin65 to the "low" position, the main CPU IC1104 of pin66 Go to the "high" position, then it activates the power switch Q1078 and Q1082, in order to provide 13.8 V DC to the transceiver circuitry inside.

R4003	Resistor	1K
R4004	Resistor	1K
R4005	Resistor	1K
R4006	Resistor	2K2
R5001	Resistor	10R
R5002	Resistor	10R
R5003	Resistor	1K
R5004	Resistor	1K
R5005	Resistor	1K
R5006	Resistor	2K2
VR4001	Variable resistor	10KB/10KA/SW
VR5001	Variable resistor	10KB/10KA/SW

Specification

General Specification					
Frequency Range	Receiving	VHF:136.00 – 174.00MHz(144.00-148.00MHz) UHF:400.00 – 470.00MHz(430.00-450.00MHz)			
	Transmitting	VHF:136.00 – 174.00MHz(144.00-148.00MHz) UHF:400.00 – 470.00MHz(: 430.00-450.00MHz)			
	Receiving (Airband)	AM:109.00 - 135.995MHz			
Modulation	F3, F2				
Antenna Impedance	50 Ω				
Frequency stability	±2.5ppm @ -10°C ~ +60°C				
Working Temperature	-20°C ~ +60°C				
Operating Voltage	DC 13.8V (±15%), polarity negative ground				
Current	Receiving	0.5A (Standby)			
	Transmitting	8.5A (VHF) .8.0A (UHF)			
Dimension	140 X 41.5 X 168mm (Width *Height*Depth)				
Weight	About 1KG				
Transmitter		Receiver			
Output power	High: 40W(VHF:144MHz) 35W(UHF:440MHz)	Mid-band	38.55MHz/450KHz(Main band) 49.95MHz/450KHz(Sub-band)		
	Low: 20W (VHF/UHF)	Circuit Type	Double recycling superheterodyne		
Modulation type	variable inductance	Sensitivity	≤0.2uV (12dB SINAD)		
Frequency deviation	±5KHz	Sensitivity	≤0.16uV		
Spurious radiation	≤-60dB	Selectivity	8kHz/30kHz (-6dB/-60dB)		
Microphone Impedance	2K Ω	Audio power output	2W @ 8 Ω 5% Distortion		

Statement

This manual has been sought the correctness and completeness in the process of compilation of the content. Our company are not responsible for any possible omission and writing error. Our company will reserve the right to change the product design and specification the above parameters are subject to change without notice
